SHK

Shaker Series
Enclosureless
Dust Collectors

This enclosureless dust collector is designed for the collection of sawdust and is ideal for indoor use in smaller wood shops, or for more localized extraction dedicated to specific woodworking machinery. The optional mechanical shaker cleaning system increases production time and performance by reducing labor required to maintain filter efficiency. The bags are shaken each time the fan is switched off by means of a push button. The filter housing supports polyester filter sleeves fixed by double snap rings into a tube sheet which is mounted atop the material collection hopper. Collected material is discharged into heavy duty plastic bags. The collector frame is made of galvanized sheet steel. The material handling fan is rated for S1 duty cycle (continuous running), and features a high-efficiency IP55 motor.

The SHK is available with an optional collection hopper with rotary screw extractor and rotary air lock instead of a hopper and bag configuration. Forklift dump bins are available for select models. Barrels with sight glass are available for all models.
